Onderwerp
Aanvullende Review Stabiliteitsbeschouwing Zeewering

Geachte heer ,

Voor de aanlanding van elektriciteitskabels in mantelbuizen van Tennet heeft NRG een stabiliteitsbeschouwing van de zeewering uitgevoerd. De mantelbuizen worden aangelegd door middel van een horizontaal gestuurde boring onder de zeewering. Er zijn 4 horizontaal gestuurde boringen naast elkaar gepland.

Deltaires heeft van NRG opdracht gekregen om een review uit te voeren van het rapport van de stabiliteitsbeschouwing met document nummer 6000-1356-BER-00187 versie 01. De resultaten van deze review zijn gerapporteerd en op 2 oktober verzonden aan NRG. NRG heeft op basis van de gemaakte opmerkingen een aangepaste versie aan Deltaires verstuurd met verzoek om een aanvullende review.

Deltaires concludeert dat in de versie 02 (20 oktober 2020) de door Deltaires gemaakte opmerkingen zijn verwerkt en dat het rapport het effect van de boorwerkzaamheden bij aanleg van de mantelbuizen op de waterveiligheid van de waterkering op een goede manier in beeld brengt. De eindconclusie dat de effecten van de horizontaal gestuurde boringen geen bijdrage leveren aan de overstromingskans van de waterkering, wordt door Deltaires onderschreven. Voor de volledigheid dient te worden opgemerkt dat de conclusie geldig is bij een gecontroleerde normale uitvoering van de boorwerkzaamheden.

Hoogachtend,

Adviseur

1 INLEIDING

In dit document wordt de stabiliteitsbeschouwing van de zeewering nabij het uittredepunt van HDD101 (strand Wijk aan Zee) nader toegelicht.

De aanleg van de mantelbuizen middels een horizontaal gestuurde boring kan de stabiliteit van de zeewering mogelijk nadelig beïnvloeden. HDD101 treedt uit op het strand nabij de rand van het duingebied, de boring ligt hier in de opgaande bocht onder de duin. Het tracé van de gestuurde boring en de plastische straal ten tijden van het aanleggen van de gestuurde boring dient buiten de stabiliteitszone van dit duingebied te blijven om nadelige beïnvloeding van de stabiliteit van de zeewering te voorkomen.

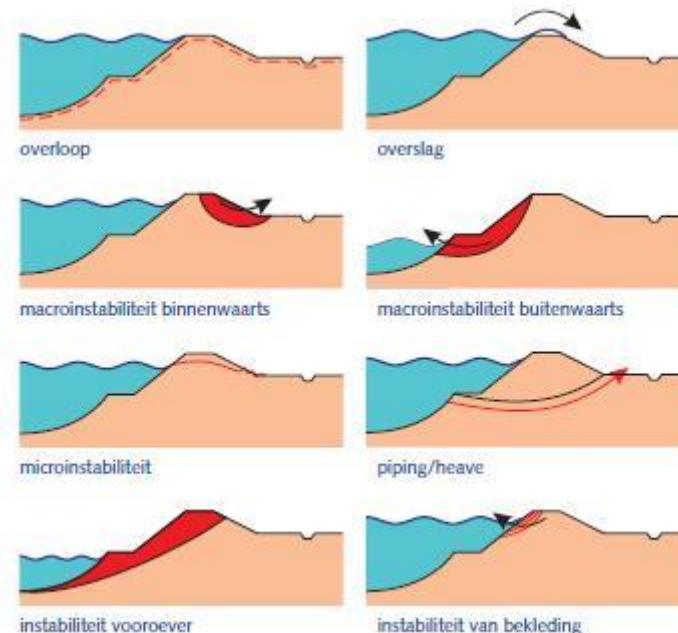

T.b.v. deze stabiliteitsbeschouwing zijn de volgende onderliggende documenten relevant:

2 STABILITEITSBEOORDELING

Een waterkering kan bezwijken als gevolg van verschillende faalmechanismen. In (Rijkswaterstaat, 2007) zijn de volgende meest relevante faalmechanismen beschreven Figuur 1).

Figuur 1 – Overzicht faalmechanismen (Rijkswaterstaat, 2007)

Het aanbrengen van de gestuurde boring heeft geen invloed op de geometrie van de zeewering. De faalmechanismen overslag, microinstabiliteit en/of instabiliteit van de bekleding zijn hiermee niet relevant. De ondergrondse grondroering kan wel invloed hebben op het faalmechanisme macrostabiliteit. Langs de aangebrachte mantelbuis kan potentieel een alternatieve (kunstmatige) kwelweg ontstaan (faalmechanisme piping/heave). Nazetting van de annulaire ruimte tussen het boorgat en de aangebrachte mantelbuis kan resulteren in een verlaging van de kruin van de waterkering. Hiervoor dient het faalmechanisme overloop beschouwd te worden.

In deze beschouwing is t.b.v. het faalmechanisme macroinstabiliteit enkel de macroinstabiliteit buitenwaarts beschouwd. Nabij de kruising van het binnentalud van de zeewering ligt de gestuurdeboring reeds nabij de maximale diepte van ca. -35m NAP. Er heerst hier een gronddekking van tenminste 40m tussen het maaiveld en de gestuurde boring, deze situatie is niet relevant beoordeeld.

Voor de beoordeling van het faalmechanisme macroinstabiliteit buitenwaarts is de stabiliteitszone van de waterkering is bepaald. Hiervoor is gemaakt van het programma D-Geo Stability v18.1 van Deltares. Hieruit volgt een (kritisch) glijvlak welke het grondmassief begrenst en de stabiliteit van de waterkering waarborgt. Met behulp van het tracé ontwerp en de sterkteberekening van de gestuurde boring kan bepaald worden of:

- het ontwerp buiten deze stabiliteitszone blijft;
- of de plastische straal als gevolg van de benodigde boorvloeistofdrukken buiten deze stabiliteitszone blijft en/of de stabiliteitszone negatief beïnvloed;

Tijdens het uitvoeren van de gestuurde boring zal er een hulpconstructie gerealiseerd worden op het strand bestaande uit een plaatselijke verhoging van het maaiveldniveau (terp). De invloed van de

aanwezigheid van deze hulpconstructie t.o.v. de huidige situatie (nul-situatie) op het kritische glijvlak is beschouwd.

De aanpak van de stabiliteitsbeoordeling kan in de volgende stappen worden samengevat:

1. Beschouwing nul-situatie

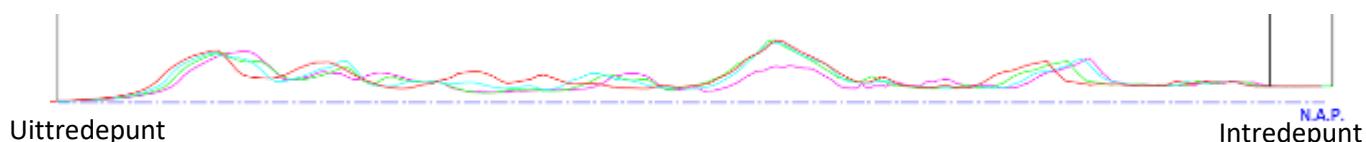

Vanuit de beschouwing van het faalmechanisme macrostabiliteit voor de huidige situatie volgt het kritische glijvlak. Deze dient als referentie.

2. Beschouwing situatie uitvoering gestuurde boring

De aanpassingen aan het strandprofiel worden toegevoegd (opbouw hulpconstructie), het kritische glijvlak wordt bepaald voor deze situatie. De omvang van de plastische straal is opgenomen in het model, hiermee wordt de invloed van de uitvoering van de gestuurde boring gemodelleerd.

3 RANDVOORWAARDEN

HDD101 bestaat uit een viertal parallel uitgevoerde gestuurde boringen (HDD101A-D, zie Figuur 2). De vier boringen zijn qua ontwerp eenduidig met dezelfde in- en uittredenhoeken, bochtstralen en diepteliggeling. De ontwerpberekeningen, waaronder de sterkteberekeningen en deze stabiliteitsbeschouwing, is één representatieve ontwerpberekening uitgevoerd van boring HDD101C. Het maaiveldverloop is voor deze boring het meest gemiddeld.

Figuur 2 - Maaiveldprofielen HDD1, Magenta 101A, Groen 101B, Cyaan 101C en Rood 101D

3.1 GLIJVLAKMODEL

De bepaling van de geometrische omvang van het kritische glijvlak is uitgevoerd m.b.v. het softwarepakket D-Geo Stability. Er zijn diverse glijvlakmodellen beschikbaar in D-Geo Stability, waaronder. Voor de bepaling van een cirkelvormig glijvlak kan gekozen worden tussen Fellenius en Bishop. In het glijvlakmodel wordt de ratio van het aanvoerend moment (grondmassief) weggezet tegen het weerstandsmoment (schuifspanning). Bij het Bishop glijvlakmodel wordt t.o.v. het Fellenius glijvlakmodel ook het effect van cohesie en/of wrijving meegenomen.

Naast een cirkelvormig glijvlak kan ook gerekend worden met een volledig door de gebruiker samengestelde afschuifmassief (Spencer) of een horizontaal afgevlakte glijcirkel (Uplift Van en Uplift Spencer). Deze modellen zijn toepasbaar in situaties waarbij het glijvlak plaats vindt over de overgang van slappe lagen of een andere specifiek glijvlak.

Gezien de uniformiteit van de grondopbouw (zand pakket) wordt gebruik gemaakt van het Bishop glijvlakmodel waarin glijvlakcircels worden beschouwd. Een glijvlak beschouwing (niet cirkelvormig) over het kleipakket is niet beschouwd gezien de diepte van deze laag (ca. -19m NAP).

3.2 ALGEMENE GEGEVENS ZEEKERING

HDD101 kruist het Noordhollands duinreservaat nabij Wijk aan Zee (Helpdesk water, 2020). Dit betreft dijkvak 13-1 welke een lengte heeft van 31.5km (Figuur 3). De wettelijk opgekomen overstromingskans (signaleringswaarde) is gelijk aan 1/3000 (jaar) met een ondergrens (norm faalkans) van 1:1000 (jaar).

De geometrie (maaveldverloop) van de kering en het duingebied is t.b.v. het ontwerp en de sterke-/stabiliteitsberekening afgeleid uit het algemeen hoogtebestand nederland (AHN3). (Actueel Hoogtebestand Nederland, 2020)

Figuur 3 – Ligging dijkvak 13-1 (Helpdesk water, 2020)

3.3 VEILIGHEIDSFACTOR

In de beschouwing van de glijvlakken wordt het grondmassief van het glijvlak in stand gehouden door de schuifweerstand langs dit vlak. Het evenwicht van het aandrijvend moment (grondmassief) en het tegenwerkend moment (schuifspanning) kan worden uitgedrukt als een factor. Bij een factor groter dan 1 is de stabiliteit van de beschouwde glijcirkel gewaarborgd. Het kritische glijvlak is het glijvlak waarvoor de evenwichtsfactor minimaal is.

Voor het ontwerp van een waterkering wordt rekening gehouden met veiligheidsfactoren welke de veiligheidsmarge van het tegenwerkend moment, en daarmee de evenwichtsfactor, vergroot ($FS_{min} \geq 1$). De gestuurde boring heeft geen invloed op het initiële ontwerp van de zeewering. De evenwichtsfactor met daarin de veiligheidsfactor is bepaald als een minimale toetsingswaarde. Deze minimale toetsingswaarde is voornamelijk relevant als toetsingswaarde t.b.v. de toetsing van de tijdelijke situatie (aanbrengen hulpconstructie) tijdens het uitvoeren van de gestuurde boring.

De minimale evenwichtswaarde (FS_{min}) is bepaald conform de schematiseringshandleiding macroinstabiliteit en bestaat uit de combinatie van 3 factoren:

$$FS_{min} = \gamma_n \cdot \gamma_d \cdot \gamma_m$$

Waarin:

γ_n = Schadefactor

γ_d = Modelfactor

γ_m = Materiaalfactor

3.3.1 Schadefactor

De faalkans per doorsnede voor macroinstabiliteit ($P_{eis,dsn}$) kan als volgt bepaald worden:
(Rijkswaterstaat 2017, formule 2.11):

$$P_{eis,dsn} = \frac{f \cdot norm}{\left(1 + \frac{a \cdot L}{b}\right) \cdot P_{f|inst}}$$

Waarin:

ϕ^{-1} = Inverse Gauss kans functie

$norm$ = veiligheidsnorm, 1/1000 voor het beschouwde traject 13-1 (zie sectie 3.2) (1/jaar)

f = toelaatbare kans overstroming door instabiliteit = $f \cdot norm$; 0,1 (-)

a = a verdisconteert twee fenomenen, 1) het niet substantieel bijdragen van alle dijkvakken in de ring aan de instabiliteitskans van de ring en 2) aanwezige correlatie tussen de instabiliteitskansen van de afzonderlijke dijkvakken; 0,033

L = totale lengte van de waterkering (m); ca. 31.5km voor het beschouwde traject 13-1 (zie sectie 3.2)

b = representatieve lengte voor de analyse in een doorsnede (m); 50 m

$P_{f|inst}$ = kans op falen gegeven een instabiliteit (-); 0,1 t.b.v. macro-instabiliteit buitenwaarts

De schadefactor (γ_n) is afhankelijk van de betrouwbaarheidsindex per doorsnede voor macroinstabiliteit ($\beta_{eis,dsn}$) van het beschouwde dijkvak (Rijkswaterstaat 2017, formule 2.12):

$$\gamma_n = 0,15 \cdot \beta_{eis,dsn} + 0,41 \text{ en } \beta_{eis,dsn} = -\phi^{-1}(P_{eis,dsn})$$

Hieruit volgt dat de betrouwbaarheidsindex voor dijkvak 13-1 gelijk is aan 4,13 wat correspondeert met een schadefactor $\gamma_n = 1,03$.

3.3.2 Modelfactor

Voor het gebruikte glijvlakmodel van Bishop geldt een materiaalfacto (γ_m) van $\gamma_d = 1,11$ (Rijkswaterstaat, 2017, tabel 2-4)

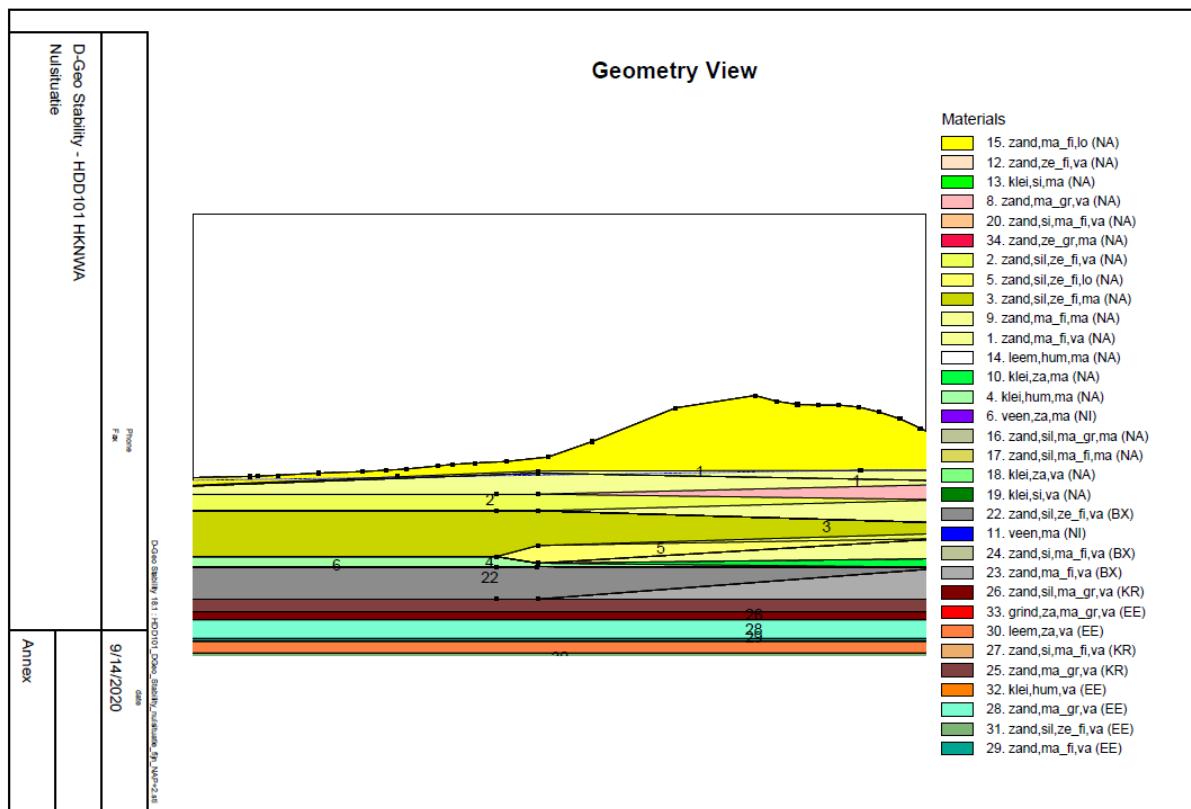

3.3.3 Materiaalfactor

De materiaalfactor (γ_m) is voor het gebruikte model (Hoek van inwendige wrijvign) gelijk aan $\gamma_m = 1,0$ conform de schematiseringshandleiding (Rijkswaterstaat, 2017, tabel 2-3)

De minimale veiligheidsfactor bedraagt hiermee $FS_{min} = 1,03 \cdot 1,11 \cdot 1,0 = 1,14$.

3.4 GRONDSTERKTEPARAMETERS

De grondopbouw is reeds geanalyseerd als onderdeel van de ontwerpnota (Tabel 2) en opgesteld t.b.v. de sterkteberekening van de gestuurde boring. Voor de stabiliteitsbeschouwing t.b.v. macroinstabiliteit is deze grondopbouw geïmporteerd in D-Geo Stability (Figuur 4) afkomstig uit het ontwerprapport HDD101 van Deltares (Deltares, 2020).

Figuur 4 – Opbouw grondmodel

In D-Geo stability zijn diverse schuifspanningsmodellen (methodes) beschikbaar. De keuze in model is onder andere afhankelijk van de beschikbare data en de doorlatendheid van de grondlagen. Op moment van schrijven zijn er geen gemeten /geanalyseerde gegevens beschikbaar naast de regulier uitgevoerde sonderingen en mechanische grondboringen. De duin is opgebouwd uit fijn, goed doorlatend zand .Voor het berekenen van de gedraineerde schuifsterkte van goed doorlatende grondlagen wordt in het WBI 2017 uitgegaan van het Mohr-Coulomb criterium (C-phi model met dilatantie).

De karakteristieke grondsterktparameters (γ_{sat} , γ_{dry} , C , φ) dienen bij voorkeur lokaal worden bepaald middels laboratorium onderzoek, dit is voor deze locatie niet uitgevoerd. Om inzicht te krijgen in de lokale parameters wordt er binnen het WBI2017 in dat geval aangeraden om gebruik te maken van de Stochastische Ondergrondschematisatie, deze is echter niet opgesteld voor duingebieden. Zodoende wordt teruggevallen op de de default parameters (karakteristieke waarden) conform de schematiseringshandleiding macroinstabiliteit (zie Figuur 5).

| Grondsoort | SOS eenheid | Verzadigd volumiek gewicht γ_{sat} [kN/m³] |
|-----------------------------|---|---|
| Veen mineraalarm | H_Vhv_v | 10 - 11 |
| Verslagen veen / detritus | H_Vhv_v, H_Ml_ko | 10 - 11 |
| Veen kleiig | H_Rk_vk | 11 - 12 |
| Veen compact | H_Vbv_v | 10 - 12 |
| Gyttja | Diversen ¹⁾ | 10,5 - 13 |
| Klei venig / klei organisch | H_Mp_ko, H_Ml_ko, H_Rr_o&z, H_Rk_k&v | 12 - 14 |
| Klei | H_Mp_k, H_Rk_k, P_Mp_k, P_Om_k, P_Ova_sd | 13 - 16 |
| Klei zandig en siltig | H_Mr_kz, H_Mkw_z&k, H_Ro_z&k, P_Rk_k&s, P_Rbk_z&s | 16 - 21 |
| Zand | Diversen | 18 - 21 |
| Loss | P_Wls_s | 16 - 21 |
| Keileem | P_Gkl_kz | 19 - 23 |
| Dijksmateriaal | H_Aa_ht | 14 - 21 |

| Grondsoort | WBI-SOS eenheid | Karakteristieke waarde φ' [°] |
|---|-------------------------------------|---------------------------------------|
| Matig gesorteerd matig hoekig kwartszand | H_Rg_z.. en P_Rg_z.. | 32,4 |
| Goed gesorteerd afgerond kwartszand (dekzand) | P_Wdz_zf | 28,6 |
| Zand met kleilaagjes (getijdenafzettingen) | Diversen | 29,9 |
| Zandige en siltige klei, löss, keileem | H_Ro_z&k, H_Rk_k, P_Wls_s, P_Gkl_kz | 29,9 |
| Dijksmateriaal | H_Aa_ht | 29,0 |

Figuur 5 - karakteristieke waarden voor γ_{sat} (tabel 7.1) en φ' (tabel 7.2)

Voor γ_{dry} geldt (Rijkswaterstaat, 2017, p. 58):

Wanneer grond boven het freatisch vlak ligt, is de grond nog deels met water verzadigd. Het volumegewicht is dan nagenoeg gelijk aan het verzadigde volumege wicht en dit laatste getal wordt gebruikt. Zand is hierop een uitzondering. Voor zand boven het freatisch vlak is het volumege wicht 16 tot 18 kN/m³.

Voor de karakteristieke waarde van het volumiek gewicht wordt een ondergrens al bovengrens gegeven. Het volumiek gewicht kan zowel een positief effect (via schuifsterkte en tegenwerkend moment) als een negatief effect (via aandrijvend moment) hebben in een stabiliteitsanalyse. Zodoende zijn per beschouwde situatie twee scenario's doorgerekend. Eén met de ondergrens en één met de bovengrens van het volumiek gweicht.

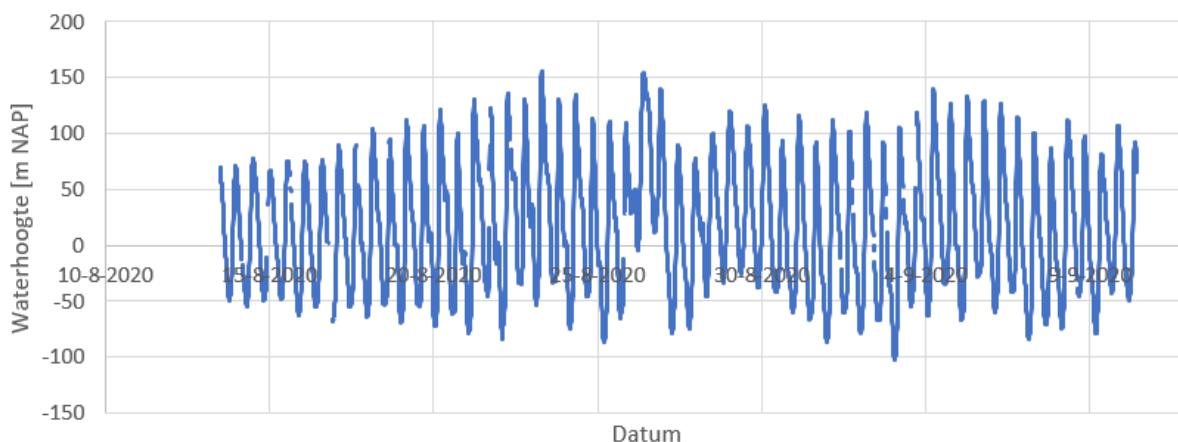

Voor de dilatantiehoek (ψ) is een defaultparameter van 0° gebruikt. Voor cohesie is in het zandpakket de default parameter (0) toegepast (geen cohesie).

3.5 GEOHYDROLOGIE

De kritieke situatie voor Macrostabiliteit buitenwaarts is niet een hoge waterstand aan de buitenzijde van de waterkering, maar juist een lage waterstand in combinatie met een hoge grondwaterstand.

De laagwaterstand (en de daarmee direct corresponderende grondwaterstand nabij het strand) aan ze zeezijde is afgeleid uit de openbare meetgegevens van Rijkswaterstaat nabij de IJgeul stroommeetpaal (Figuur 6). De periode bedraagt 13-08-2020 t/m 10-09-2020. De gemiddelde waterhoogte is gelijk aan 0.14m NAP met een laagst gemeten waarde van -1.02m NAP. (Rijkswaterstaat, 2020). Deze is aangehouden als (grond)waterstand buitendijks.

Waterhoogte IJgeul stroommeetpaal

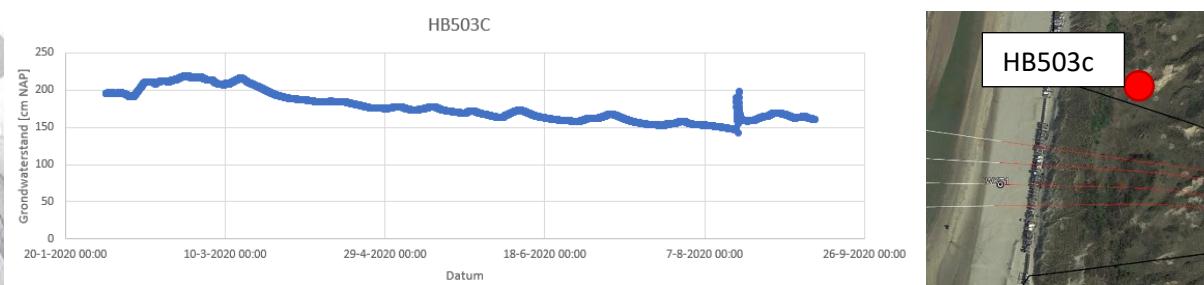

Figuur 6 – Gemeten waterhoogte nabij IJgeul stroommeetpaal (Rijkswaterstaat, 2020)

De freatische waterstand in de duinen is afgeleid uit de aangebrachte peilbuizen. In de ontwerpnota (Tabel 2) is het verloop van de freatische waterstand over het boortracé reeds beschouwd. Hieruit volgt dat er een natuurlijk verloop aanwezig is tussen de waterstand nabij het intredepunt (WKT2) en de waterstand op het strand.

De passages van de verschillenden duinen kunnen resulteren in een mogelijk beïnvloeding vochtfronten in duinen op lokale freatische grondwaterstand (opbolling). Enkele filterstellingen zijn geplaatst in de verschillende duin (boven de gemiddeld hoogte; HB503b, HB501A) alsmede filterstellingen onder dezelfde duinen (onder de gemiddelde maaiveldhoogte naast de duin; HB503c, 501C). (Schijn)freatische grondwaterstanden zijn waargenomen in de hoog gelegen filterstellingen, vergelijking met de ondergelegen filterstellingen toont aan dat deze (schijn)freatische grondwaterstanden geen invloed op de grondwaterstand van het freatische grondwater.

Voor de bepaling van de freatische grondwaterstand in het duingebied is gebruik gemaakt van peilbuis HB305c, deze peilbuis is gepositioneerd in de eerste rij duinen. De filterstelling is aangebracht op +0.8m t/m -0.15m NAP. Vanuit de tijdserie (Figuur 7) is de hoogst gemeten grondwaterstand bepaald welke gehouden is in de stabiliteitsbeschouwing, deze ligt op +2.19m NAP.

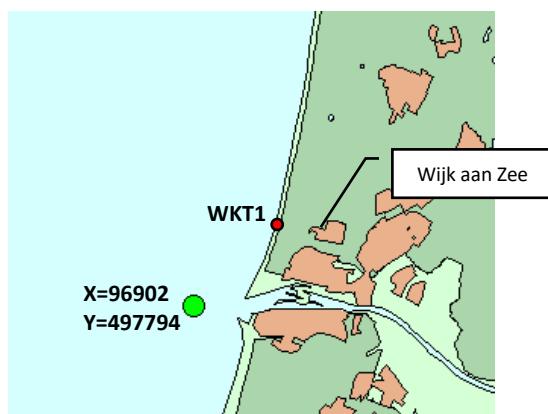

Figuur 7 – Gemeten freatische grondwaterstand HB503C

Er zijn geen gegevens over het verloop van de freatische grondwaterstand tussen het strand en het meetpunt HB503c, er is gebruik gemaakt van een graduueel verloop tussen de twee meetpunten.

Voor de beschouwing van het faalmechanisme golvoeverloop en piping is juist de hoogwaterstand maatgevend. Hiervoor geldt de buitenwatertand bij norm als randvoorwaarde. De buitenwaterstand bij norm is bekend ter hoogte de Havenmond van IJmuiden (Figuur 8, X=96902, Y=497794), deze locatie ligt nabij het uittredepunt van HDD101 (WKT1) bij Wijk aan Zee. In Tabel 3 is de waterstand behorend bij de frequentie weergeven, deze is gegenereerd m.b.t. Hydra-NL op basis van de WB2017_Hollandse_Kust_Noord_13-4_v03-database.

De norm van de faalkans van dijkvak 13-1 is gelijk aan 1/1000 (zie sectie 3.5). De bijbehorende waterstand bij norm is hiermee gelijk aan +4.335m N.A.P.

| Frequentie | Waterstand (m+NAP) |
|---------------|--------------------|
| 1/10 | 2.914 |
| 1/30 | 3.236 |
| 1/100 | 3.599 |
| 1/300 | 3.944 |
| 1/1000 | 4.335 |
| 1/3000 | 4.709 |
| 1/10000 | 5.136 |

Tabel 3 – Watertand bij norm voor verschillende normen

Figuur 8 – Locatie data waterstand behorend bij frequentie

4 BESCHOUWING MACROINSTAIBLITEIT

In D-Geo stability worden glijcirkels gegenereerd en getoetst middels een door de gebruiker opgegeven 'grid' van mogelijk middelpunten van de cirkel alsmede horizontale tangentiële lijnen waارlangs de cirkels worden opgesteld.

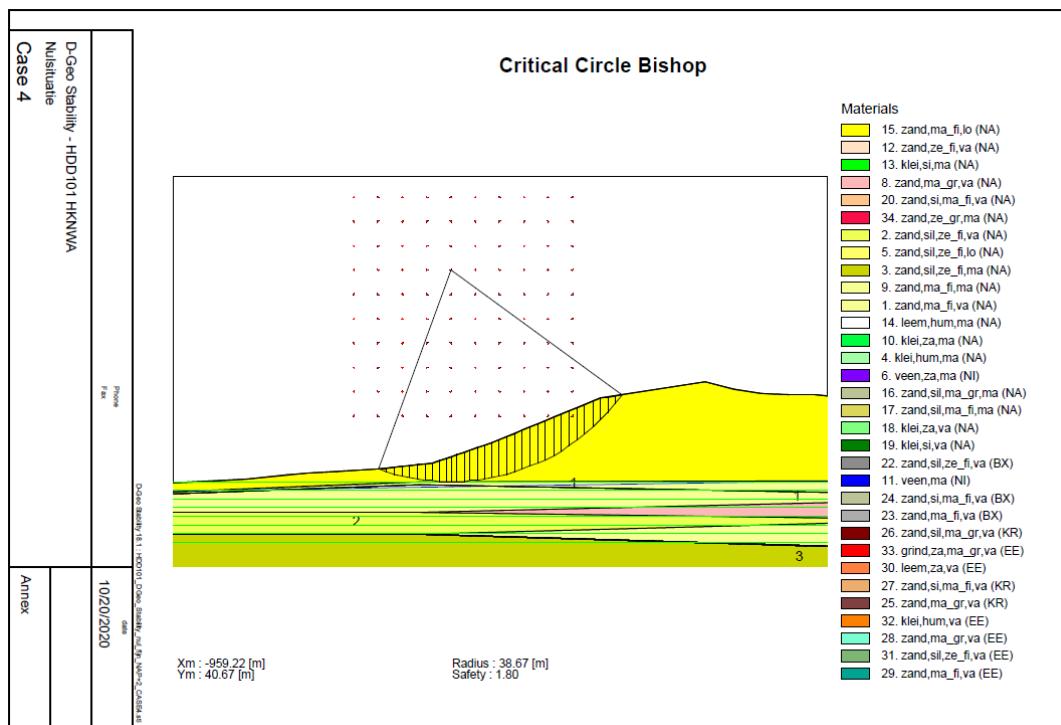

Een berekend schuifvlak moet een schuifvlak zijn dat tot functieverlies van de waterkering leidt. Dit is in het algemeen alleen het geval als het intredepunt van het schuifvlak in de kruin van de waterkering of de bovenste helft van het binnentalud ligt. De horizontale tangentiële lijnen zijn vastgesteld van +2m NAP tot -9m NAP (8 stuks). Met een hogere ligging worden ook afschuivingen van het Duintalud zelf getoetst (niet relevant). Als de horizontale tangentiële lijnen te diep gekozen worden (waarbij ondiepere dieptes worden uitgesloten) dan worden de glijcirkels automatisch groter wat resulteert in een groter gemobiliseerd grondmassief en dus een hogere veiligheidsfactor.

Voor de keuze van het grid wordt iteratief gewerkt van grof naar fijn, waarbij in de 1^e iteratie een grof grid is gedefinieerd. In de vervolg iteratie(s) wordt het grid rondom het kritische glijvlak van de voorgaande iteratie gecentreerd en verfijnd.

Afhankelijk van de gekozen initiële grid definitie kan een kritisch glijvlak gevonden worden welke buiten het interessegebied van het faalmechanisme macroinstabiliteit, bijvoorbeeld in het buientalud van de zeewering (microinstabiliteit). Dergelijke kritische glijvlakken kunnen in een 2^e iteratie voorkomen worden door de desbetreffende grid punten en/of horizontale tangentiële lijnen uit te sluiten.

4.1 NULSITUATIE (REFERENTIE)

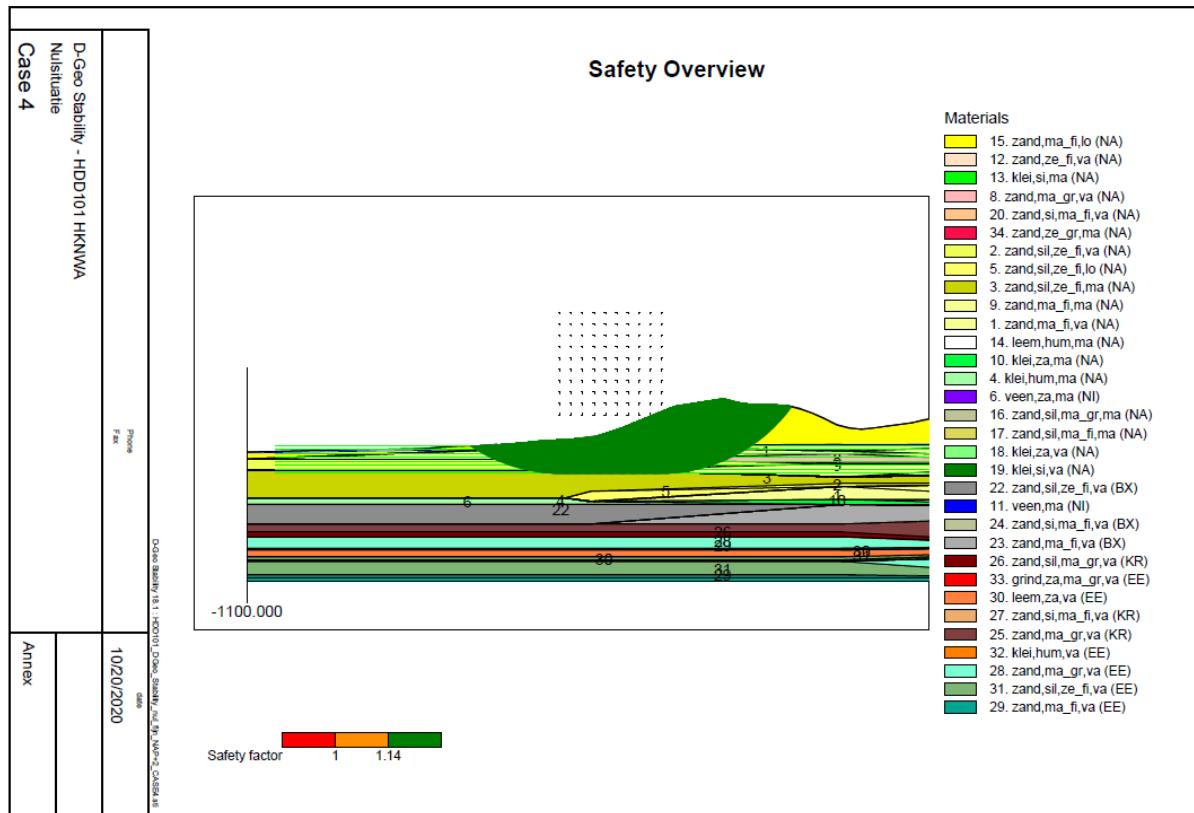

Voor de bepaling van het kritische glijvlak voor de nulsituatie ter referentie is uitgegaan van het huidige maaiveld profiel (zonder de tijdelijke hulpconstructie). Er zijn een tweetal iteraties toegepast om tot een gedetailleerde glijcirkel te komen (Figuur 9). Het scenario waarin de bovengrens van de grondparameters gebruikt zijn is maatgevend (dwz; resulteert in de laagste veiligheidsfactor)

Figuur 9 - Kritisch glijvlak nulsituatie

Het kritische glijvlak heeft een veiligheidsfactor van 1.80, deze is hiermee hoger dan de minimaal benodigde veiligheidsfactor van 1,14 (Zie sectie 3.3). De volledige rapportage van de stabiliteitsbeschouwing van de nul-situatie is opgenomen in Bijlage 1.

Naast het kritische glijvlak is in Figuur 10 is een overzicht gegeven van de overig getoetste glijvlakken. Voor alle beschouwde glijvlakken geldt dat de veiligheidsfactor tenminste groter is dan die van het kritische glijvlak $FS > 1,80$ en daarmee dus groter dan de minimaal benodigde veiligheidsfactor ($FS_{min} = 1,14$).

Figuur 10 - Overzicht getoetste glijvlakken incl. veiligheidsfactor voor de Nulsituatie

4.2 SITUATIE UITVOERING GESTUURDE BORING

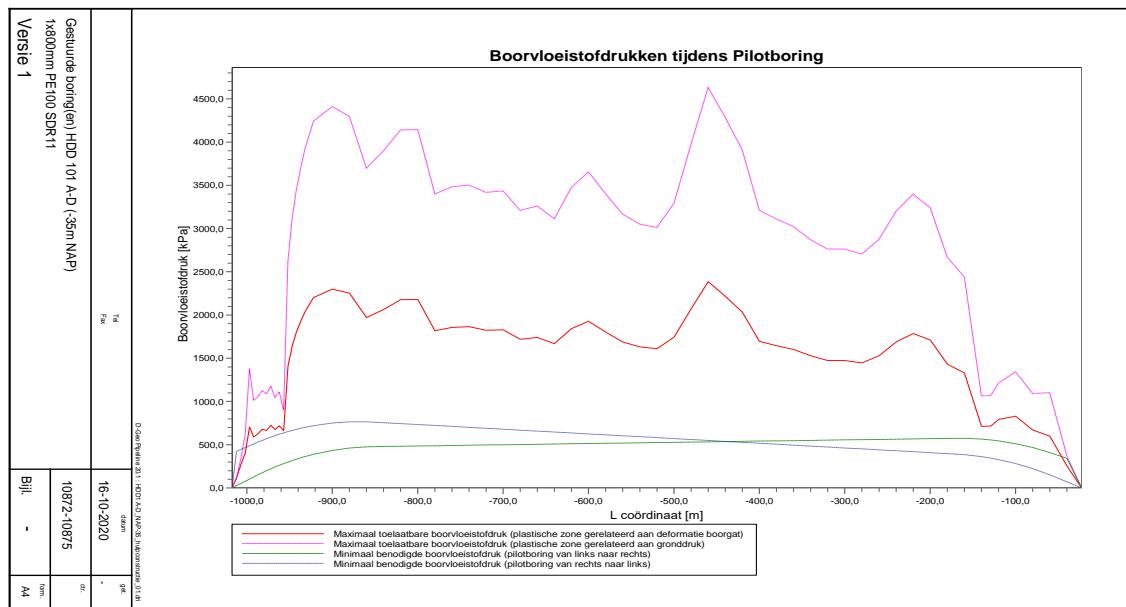

Tijdens het uitvoeren van de gestuurde boring zal een hulpconstructie worden aangebracht, zie tekening hulpconstructie (Tabel 2). Deze hulpconstructie bestaat uit een maaiveldverhoging nabij het uittredepunt van de gestuurde boring. Het effect van de hulpconstructie op het kritische glijvlak van de zeekering is beschouwd. Hiervoor is de doorsnede van de hulpconstructie als een maaiveldverhoging opgenomen in het rekenmodel (terp tot +5.9m NAP).

Aan de voor- en achterzijde van de terp wordt een grondkerende constructie aangebracht (damwanden), deze is opgenomen in het model middels een 'forbidden line'. Aan de voorzijde is de inheidiepte bepaald op -4.5m NAP in combinatie met het aanbrengen van een berm (passieve grondwig) bestaande uit GeoTubes. De geotubes zijn geschematiseerd als een grondwig met een talud.

Voor de achterste damwandrij (duinzijde) is een lengte aangenomen van 5,9m (0m NAP, grondkerende hoogte = ca. 2m).

Tijdens de gestuurde boring wordt de ondergrond lokaal geroerd. Hiervoor wordt boorvloeistof met druk aangebracht. De boorvloeistof(druk) is noodzakelijk om de vrijgekomen grond te transporteren naar het maaiveld en om het boorgat stabiel te houden. De boorvloeistofdrukken zijn tijdens de pilotboring het hoogst en daarmee maatgevend voor de beïnvloedingsbeschouwing.

De plastische zone beschrijft het invloedsgebied (straal) van de boorvloeistof rondom het boortracé. Als onderdeel van de sterkteberekening van de gestuurde boring HDD101 zijn de te verwachten boorvloeistofdrukken (blauwe en groene lijnen) bepaald (Figuur 11) alsmede de maximaal toelaatbare boorvloeistofdrukken (rode en magenta lijnen). De volledige berekening van de boorvloeistofdrukken is opgenomen in bijlage 3.

Figuur 11 – Benodigde en maximaal toelaatbare boorvloeistofdrukken tijdens pilotboring

Door een grens te stellen aan de boorvloeistofdruk (de verwachtingswaarde), kan conform de NEN 3650 de bijbehorende plastische straal bepaald worden (R_p):

$$P = [p'_f + c \cdot \cot(\varphi)] \cdot \left[\left(\frac{R_0}{R_p} \right)^2 + Q \right]^{\frac{\sin(\varphi)}{1+\sin(\varphi)}} - c \cdot \cot(\varphi) + u$$

Waarin:

P = de (verwachtingswaarde) van de boorspoeldruk

$$p'_f = \sigma'_0 (1 + \sin(\varphi)) + c \cdot \cos(\varphi)$$

$$G = \text{Glijdingsmodulus} = \frac{E}{2(1+\nu)}$$

u = de waterspanning

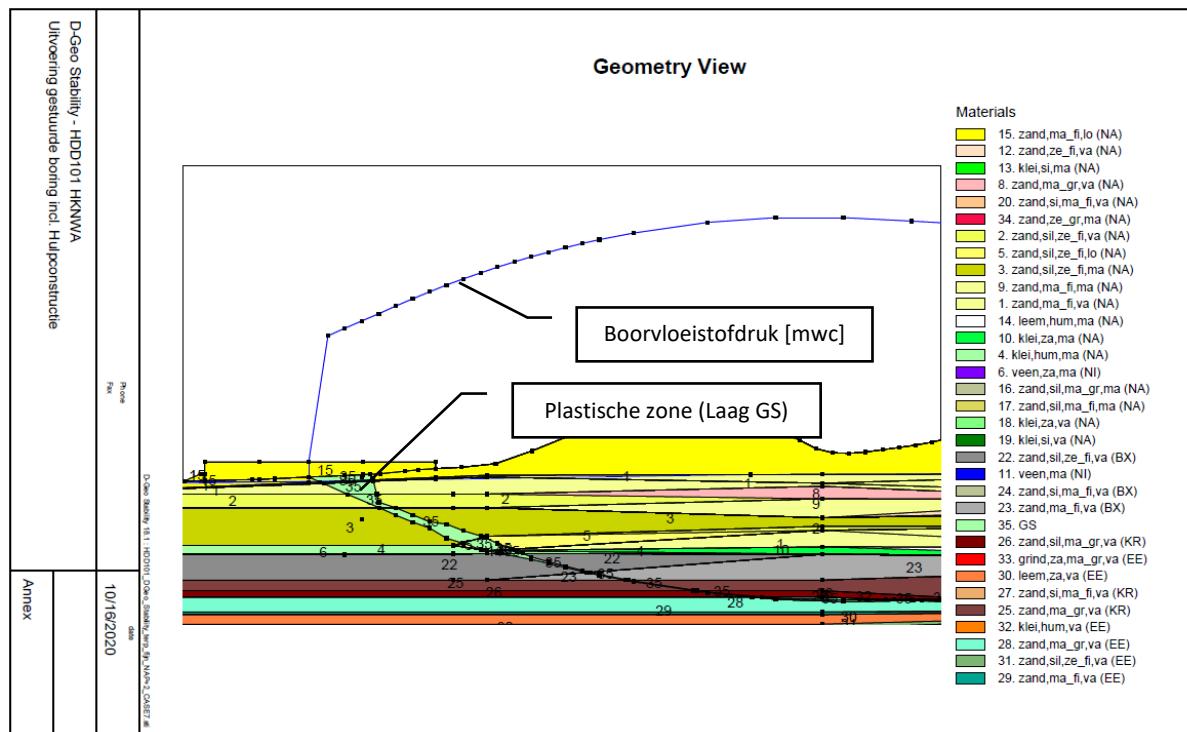

$$R_0 = \text{Initiële straal van de (pilot) boorgang} = 365/2 = 182,5$$

$$Q = (\sigma'_0 \sin(\varphi) + c \cdot \cos(\varphi))/G$$

Met behulp van deze relatie en de berekende boorvloeistofdruk vanuit de sterkteberekening van de gestuurde boring is de ontwikkeling van de plastische straal bepaald over de lengte van het boortracé. Tijdens de uitvoering van de gestuurde boring wordt mogelijk een counterdrill ingezet. Dit houdt in dat het eerste gedeelte van het boortracé (vanaf het uittredepunt op de duin, wordt voorgeboord vanaf het uittredepunt. Dit reduceert lokaal de waarden van de boorvloeistofdruk nabij

het uittredepunt (waardes boorvloeistofdruk Figuur 11 van links naar rechts). Voor de omvang van de plastische straal is echter gebruik gemaakt van de verwachte boorvloeistofdruk voor de situatie waarbij geboord vanaf het intredepunt (conservatieve situatie, waardes boorvloeistofdruk van rechts naar links Figuur 11).

De plastische zone is toegevoegd aan het model als een laag zonder sterkte (GS), zie Figuur 12. De verhoogde boorvloeistofdruk in deze zone kan standaard niet meegenomen worden in het rekenmodel (D-Geo stability). Hiervoor zijn de boorvloeistofdrukken [kN/m^3] naar een uitgedrukt in meter waterkolom. Deze representatieve waterkolom is als PN-lijn toegewezen aan de plastische zone.

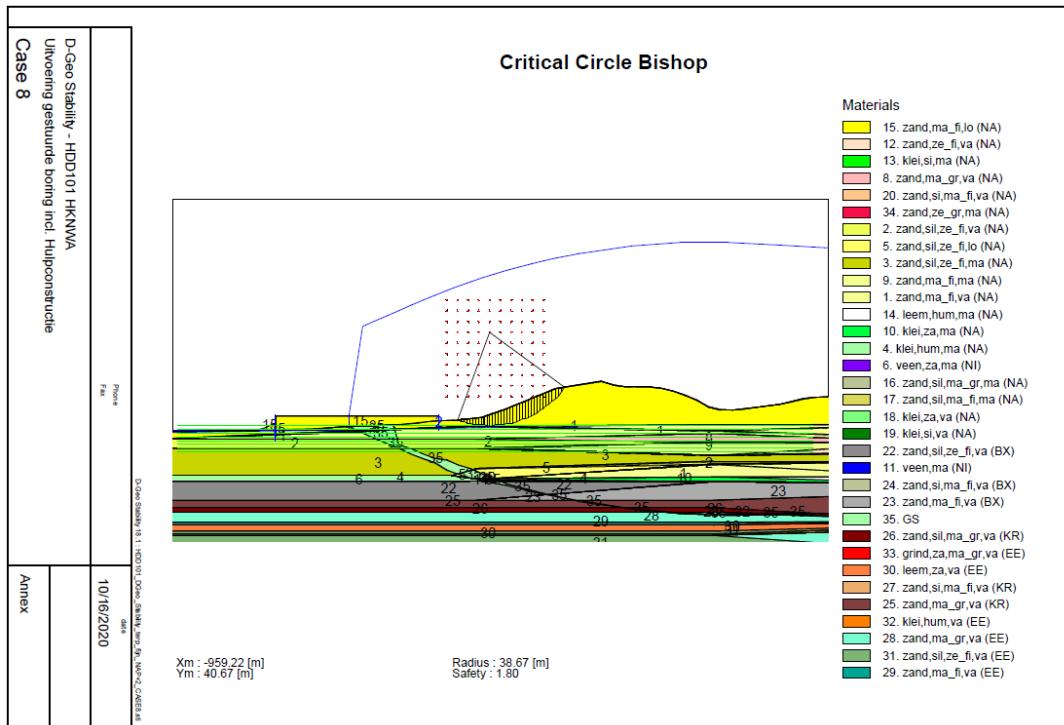

Figuur 12 - Schematisering plastische zone en boorvloeistofdruk in D-Geo stability

De omvang van de plastische straal nabij het uittredepunt neemt toe, merk hierbij op dat:

1. Over dit gebied geldt een blowout risico, dit gedeelte vindt plaats binnen de omsloten ontvangstkuip op de hulpconstructie;
2. Voor de uitvoering van deze boring wordt een counterdrill toegepast, de lokaal benodigde boorvloeistofdrukken nabij het uittredepunt zijn hierdoor significant lager (zie Figuur 11).

Er zijn een tweetal iteraties toegepast om tot een gedetailleerde glijcirkel te komen (Figuur 13). Het scenario waarin de bovengrens van de grondparameters gebruikt zijn is maatgevend (dwz; resulteert in de laagste veiligheidsfactor)

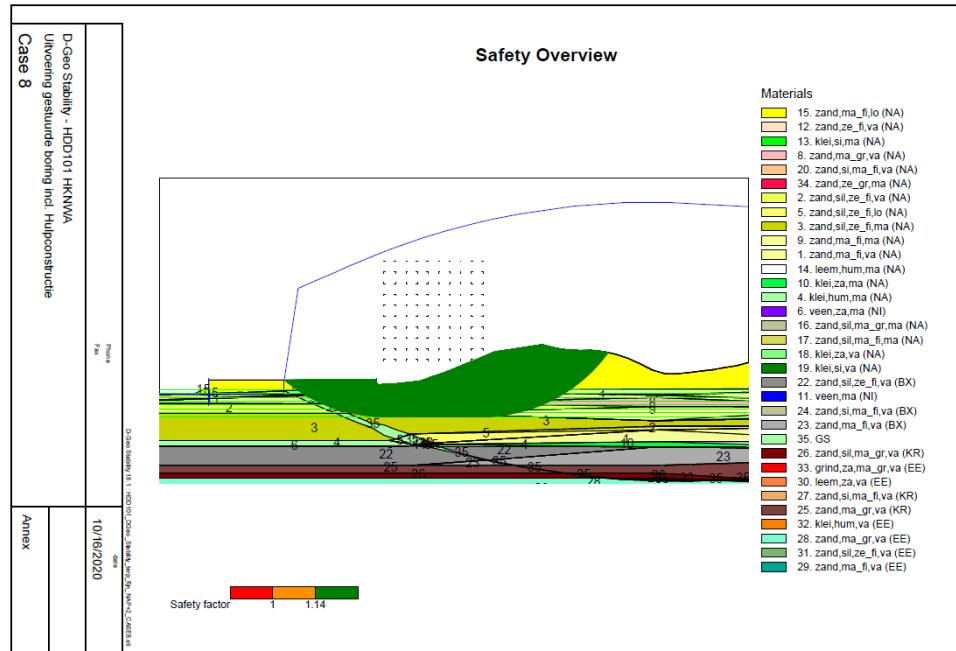

Figuur 13 - Kritisch glijvlak tijdens uitvoering gestuurde boring

Het kritische glijvlak heeft een veiligheidsfactor van 1,80, deze is hiermee hoger dan de minimaal benodigde veiligheidsfactor van 1,14 (Zie sectie 3.3) en gelijk aan de veiligheidsfactor zoals bepaald voor de nulsituatie. Ook de omvang van het kritische glijvlak is gelijk aan die van de nulsituatie. Het kritisch glijvlak blijft buiten het boortracé en de plastische zone.

Naast het kritische glijvlak is in Figuur 13 een overzicht gegeven van de overig getoetste glijvlakken. Voor alle beschouwde glijvlakken geldt dat de veiligheidsfactor tenminste groter is dan die van het kritische glijvlak ($FS > 1,80$) en daarmee dus groter dan de minimaal benodigde veiligheidsfactor ($FS_{min} = 1,14$).

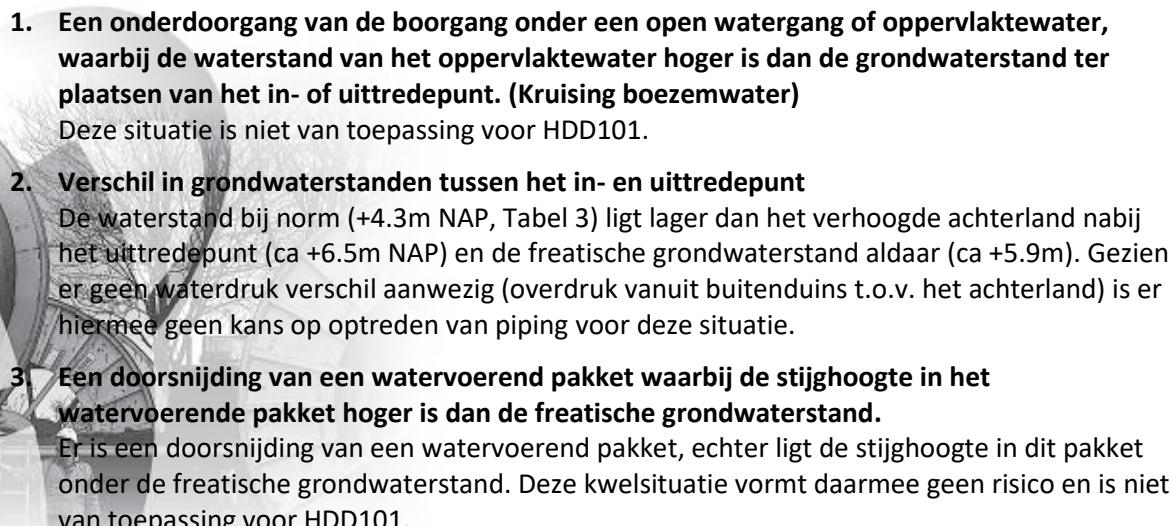

Figuur 14 - Overzicht getoetste glijvlakken incl. veiligheidsfactor voor de situatie tijdens uitvoering HHD

De volledige rapportage van de situatie tijdens de uitvoerig van de gestuurde boring is opgenomen in bijlage 2.

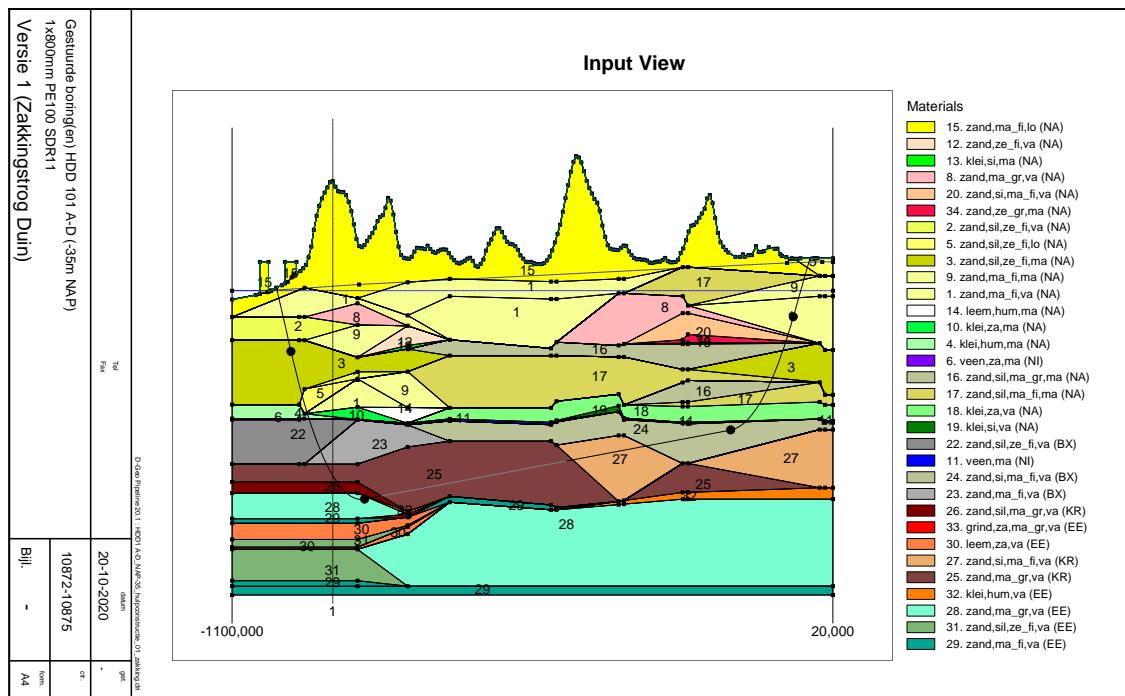

5 BESCHOUWING FAALMECHANISME PIPING/HEAVE

Met het realiseren van een gestuurde boring kan een alternatieve kwelweg worden gecreëerd waarbij kwelwater via de boorlijn door drukverschil naar het intrede of uittredepunt stroomt. Ten behoeve van de engineering van een gestuurde boring (algemeen) zijn 3 verschillende situaties gedefinieerd waarin kwel kan optreden. Hieronder zijn de situaties benoemd en beoordeeld voor HDD101:

- 
 1. **Een onderdoorgang van de boorgang onder een open watergang of oppervlaktewater, waarbij de waterstand van het oppervlaktewater hoger is dan de grondwaterstand ter plaatsen van het in- of uittredepunt. (Kruising boezemwater)**
Deze situatie is niet van toepassing voor HDD101.
 2. **Verschil in grondwaterstanden tussen het in- en uitredepunt**
De waterstand bij norm (+4.3m NAP, Tabel 3) ligt lager dan het verhoogde achterland nabij het uitredepunt (ca +6.5m NAP) en de freatische grondwaterstand aldaar (ca +5.9m). Gezien er geen waterdruk verschil aanwezig (overdruk vanuit buitenlands t.o.v. het achterland) is er hiermee geen kans op optreden van piping voor deze situatie.
 3. **Een doorsnijding van een watervoerend pakket waarbij de stijghoede in het watervoerende pakket hoger is dan de freatische grondwaterstand.**
Er is een doorsnijding van een watervoerend pakket, echter ligt de stijghoede in dit pakket onder de freatische grondwaterstand. Deze kwelsituatie vormt daarmee geen risico en is niet van toepassing voor HDD101.

6 BESCHOUWING FAALMECHANISME OVERLOOP

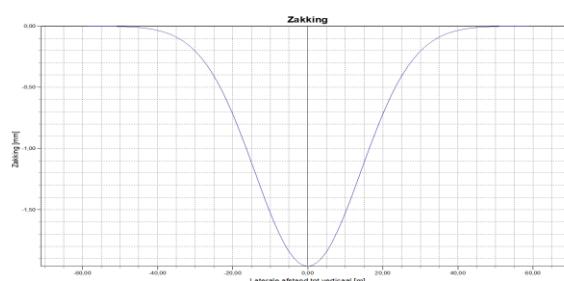

Voor de beschouwing van het faalmechanisme overloop is de nazetting van de annulaire ruimte tussen het boorgat ($\varnothing 1040mm$) en de aangebrachte $\varnothing 800mm$ mantelbuis bepaald. De beschouwde maatgevende doorsnede is het hoogste punt van de duin/kruin (Figuur 15) de lokale maaiveldhoogte bedraagt hier +19.83m NAP (afgeleid uit AHN3).

Figuur 15 -Beschouwde maatgevende doorsnede D-Geo stability (Micro tunneling module)

De zakkingsstrof op deze doorsnede is bepaald m.b.v. de Micro tunneling module in D-Geo pipeline. Als basis is het reeds opgestelde D-geo pipeline model uit het ontwerprapport van HDD101 (Deltares, 2020) gebruikt. De volledige rapportage is opgenomen in bijlage 4.

De bepaalde zakkingsstrof op de maatgevende doorsnede is opgenomen in Figuur 16. De te verachten nazetting bedraagt maximaal 2mm. Met deze geringe nazetting combinatie met de relatief hoge kruinhoogte (+19.83m NAP) t.o.v. de waterstand bij norm (+4.3m NAP) kan geconcludeerd worden dat de nazetting geen nadelig effect heeft op op het faalmechanisme overloop. De nazetting is toelaatbaar.

Figuur 16 – Zakkingstrof op maatgevende doorsnede

7 CONCLUSIE

In dit rapport is de stabiliteit van de primaire zeewaterkering beschouw (duin) nabij Wijk aan Zee in relatie tot de uit te voeren werkzaamheden (aanbrengen gestuurde boring). De stabiliteit is beschouwd voor de faalmechanismes: macroinstabiliteit buitenwaarts, piping/heave en overloop. Het aanbrengen van de gestuurde boring heeft geen invloed op de geometrie van de zeewering. De faalmechanismen overslag, microinstabiliteit en/of instabiliteit van de bekleding zijn hiermee niet relevant. Hieronder zijn de belangrijkste conclusies van binnen de beschouwingen samengevat.

7.1 FAALMECHANISME MACROINSTABILITEIT BIJTENWAARTS

Het effect van de aanleg van de mantelbuizen en de uitvoering van de gestuurde boring op de stabiliteit van de zeekering is beoordeeld middels een beschouwing op het faalmechanisme macro instabiliteit (buitenzijde) in D-Geo stability:

- Het kritische glijvlak bepaald voor de nul-situatie. De geldende veiligheidsfactor voor het kritische glijvlak (1,80) is hoger dan de minimaal toelaatbare factor (1,14).
- Met de opbouw van de hulpconstructie t.b.v. de uitvoering van de gestuurde boring veranderd het te toetsen dwarsprofiel. De invloedzone van de gestuurde boring is toegevoegd (plastische zone) aan het model alsmede de heersende boordruk in deze zone. De tijdelijke situatie is getoetst, het kritisch glijvlak is onveranderd; de veiligheidsfactor van het kritische glijvlak is in deze situatie gelijk aan 1,8 (gelijk aan de nul-situatie).
- Het kritisch glijvlak tijdens uitvoering heeft geen raakvlak met het boortracé en/of de plastische zone als gevolg van de boorvloeistofdruk.

7.2 FAALMECHANISME PIPING/HEAVE

De ligging van het achterland (intredepunt gestuurde boring, WKT2) is verhoogd t.o.v. het strandprofiel. Het achterland ligt hoger dan de waterstand bij norm (1/1000, +4.3m NAP). Op basis hiervan is geconcludeerd dat er geen kans is op het optreden van piping.

7.3 FAALMECHANISME OVERLOOP

Voor de beschouwing van het faalmechanisme overloop is de nazetting van de annulaire ruimte tussen het boorgat en de aangebrachte mantelbuis bepaald op de maatgevende doorsnede onder de kruin van de waterkering. De te verwachten nazetting is vergeleken met de kruinhoogte en de waterstand bij norm. De zettings van de eind situatie zijn gering, het effect op het faalmechanisme overloop is hiermee toelaatbaar.

PL-LINES

=====

| Pl-line no. | | Co-ordinates [m] | | | | |
|-------------|---|------------------|---|----------|---------|--------|
| 1 | - | X | - | -1100.00 | -887.35 | -65.63 |
| 1 | - | Y | - | -1.02 | 2.19 | 5.73 |
| | | | | | 0.00 | 5.12 |
| | | | | | 5.89 | 5.89 |

Unit weight of water used for calculation: 9.81 [kN/m3]
The groundwater level is determined by Pl-line number 1

FORBIDDEN LINES

No degree of consolidation <> 100% input.

CENTER POINT GRID AND TANGENT LINES

| | | |
|--|---|-------------|
| X co-ordinate grid left | : | -977.00 [m] |
| X co-ordinate grid right | : | -937.00 [m] |
| Number of grid points in X - direction | : | 10 |
| Y co-ordinate grid bottom | : | 14.00 [m] |
| Y co-ordinate grid top | : | 54.00 [m] |
| Number of grid points in Y - direction | : | 10 |
| Y co-ordinate tangent smallest circle | : | 2.00 [m] |
| Y co-ordinate tangent biggest circle | : | -9.00 [m] |
| Number of circles per grid point | : | 8 |

No fixed points input.

Total number of center points in the grid: 100
 Total number of slip circles in the grid : 800

MEASURED YIELD STRESS

=====

No measured yield stress input.

LINE LOADS

=====

No line loads were input.

UNIFORM LOAD

=====

No uniform loads were input.

TREE ON SLOPE

=====

No tree on slope was input.

EARTHQUAKE

=====

No earth quake factors were input.

***** The input has been tested, and is correct. *****

↑

RESULTS OF THE SLOPE STABILITY ANALYSIS

=====

Minimum safety factor per slip circle.

| X-coord [m] | Y-coord [m] | Radius [m] | F |

Information on the critical circle : Fmin = 1.802
 Calculation method used : Bishop - C phi

X co-ordinate center point : -959.22 [m]
 Y co-ordinate center point : 40.67 [m]
 Radius of critical circle : 38.67 [m]

The center point of the critical circle is enclosed
 The circle lies along the top tangent line

Total driving moment : -43466.36 [kNm/m]
 Driving moment free water : 0.00 [kNm/m]
 Driving moment external loads : 0.00 [kNm/m]
 Iterated resisting moment : 78313.16 [kNm/m]
 Non-iterated resisting moment : 73393.15 [kNm/m]

BIJLAGE 2: RAPPORTAGE D-GEO STABILITY – UITVOERING GESTUURDE BORING

Program : D-Geo Stability
Version : 18.1.1.3
Company :
Date : 10/16/2020
Time : 11:32:21 AM

Output file : \\tsclient\cmu\Van Vulpen B.V\TempHKNWA - Documenten\04
Technischmanagement\04.01 Ontwerp\HDD\HDD101\Berekeningen\D-Geo Stability\D-Geo
stability files+plots\V2\Case 8\HDD101_DGeo_Stability_terp_fijn_NAP+2_CASE8.sto
Input file : \\tsclient\cmu\Van Vulpen B.V\TempHKNWA - Documenten\04
Technischmanagement\04.01 Ontwerp\HDD\HDD101\Berekeningen\D-Geo Stability\D-Geo
stability files+plots\V2\Case 8\HDD101_DGeo_Stability_terp_fijn_NAP+2_CASE8.sti
===== BEGINNING OF DATA =====

ECHO OF THE INPUT
=====

Problem identification : D-Geo Stability - HDD101 HKNWA
: Uitvoering gestuurde boring incl. Hulpconstructie

Calculation model : Bishop
Default shear strength : C phi

LAYER BOUNDARIES

Unit weight of water used for calculation: 9.81 [kN/m³]
The groundwater level is determined by Pl-line number 1

CENTER POINT GRID AND TANGENT LINES

| | | |
|--|---|-------------|
| X co-ordinate grid left | : | -977.00 [m] |
| X co-ordinate grid right | : | -937.00 [m] |
| Number of grid points in X - direction | : | 10 |
| Y co-ordinate grid bottom | : | 14.00 [m] |

Y co-ordinate grid top : 54.00 [m]
Number of grid points in Y - direction : 10

Y co-ordinate tangent smallest circle : 2.00 [m]
Y co-ordinate tangent biggest circle : -9.00 [m]
Number of circles per grid point : 8

No fixed points input.

Total number of center points in the grid: 100
Total number of slip circles in the grid : 800

MEASURED YIELD STRESS
=====

No measured yield stress input.

LINE LOADS
=====

No line loads were input.

UNIFORM LOAD
=====

No uniform loads were input.

TREE ON SLOPE
=====

No tree on slope was input.

EARTHQUAKE
=====

No earth quake factors were input.

***** The input has been tested, and is correct. *****

↑

RESULTS OF THE SLOPE STABILITY ANALYSIS

=====

Minimum safety factor per slip circle.

=====

Information on the critical circle : Fmin = 1.802
 Calculation method used : Bishop - C phi

X co-ordinate center point : -959.22 [m]
 Y co-ordinate center point : 40.67 [m]
 Radius of critical circle : 38.67 [m]

The center point of the critical circle is enclosed
 The circle lies along the top tangent line

Total driving moment : -43477.29 [kNm/m]
 Driving moment free water : 0.00 [kNm/m]
 Driving moment external loads : 0.00 [kNm/m]
 Iterated resisting moment : 78331.80 [kNm/m]
 Non-iterated resisting moment : 73410.65 [kNm/m]

BIJLAGE 3: RAPPORTAGE D-GEO PIPELINE (BOORONTWERP)

Rapport voor D-Geo Pipeline 20.1

Model : Horizontaal Gestuurde Boring
Ontwikkeld door Deltares

Datum van rapport: 31-8-2020

Tijd van rapport: 15:18:27

Rapport met versie: 20.1.1.30040

Berekend met versie: 20.1.1.30040

Bestandsnaam: HDD1 A-D_NAP-35_hulpconstructie_01

Projectbeschrijving: Gestuurde boring(en) HDD 101 A-D (-35m NAP)
1x800mm PE100 SDR11
Versie 1

2.6 Grenslagen

De grens tussen (cohesieve) ongedraaide toplagen en onderliggende (niet-cohesieve) gedraaide lagen, ligt aan de bovenzijde van laag nummer 61: zand,ma_fi,lo (NA)

De grens tussen compressibele toplagen en de onderliggende niet-compressibele lagen, ligt aan de bovenzijde van laag nummer 61: zand,ma_fi,lo (NA)

2.7 Grondeigenschappen

Locaties berekenings verticalen; L is de horizontale coördinaat langs de leiding geprojecteerd op het horizontale vlak, opgehoogd met de intrede coördinaat.

2.10 Verkeersbelasting

| | |
|-------------------------------|-------------|
| Heemskerkerweg | |
| L begin | -101,00 [m] |
| L einde | -94,36 [m] |
| Belastingsmodel (grafiektype) | Graph I |
| Meeuweweg | |
| L begin | -131,36 [m] |
| L einde | -127,36 [m] |
| Belastingsmodel (grafiektype) | Graph I |

2.11 Configuratie van de Pijpleiding

| | |
|--|---------------|
| X coördinaat linker punt | -1017,320 [m] |
| Y coördinaat linker punt | 0,000 [m] |
| Z coördinaat linker punt | 1,500 [m] |
| X coördinaat rechter punt | -41,083 [m] |
| Y coördinaat rechter punt | 0,000 [m] |
| Z coördinaat rechter punt | 6,513 [m] |
| Hoek links | 22,0000 [grd] |
| Hoek rechts | 18,0000 [grd] |
| Kromtestraal links, verticaal in/uit | 350,000 [m] |
| Kromtestraal rechts, verticaal in/uit | 400,000 [m] |
| Kromtestraal rollenbaan (intrekboog) | 350,000 [m] |
| Diepste punt van de pijpleiding (hart boortracé) | -35,000 [m] |
| Hoek van de pijpleiding (tussen de stralen) | 1,0000 [grd] |

Aantal horizontale bochten: 1
 De pijpleiding wordt van links naar rechts ingetrokken.

| Bocht nr. | X1-coörd. [m] | Y1-coörd. [m] | X2-coörd. [m] | Y2-coörd. [m] | Kromtestraal [m] | Richting |
|-----------|------------------|------------------|------------------|------------------|---------------------|----------|
| 1 | -827,268 | 56,466 | -486,449 | 76,656 | 750,000 | links |

2.12 Materiaalgegevens van de Leiding

| | |
|-------------------------------------|-----------------------------|
| Materiaal | Polyethleen |
| Kwaliteit | PE100 |
| Elasticitetsmodulus (kort) | 975,00 [N/mm ²] |
| Elasticitetsmodulus (lang) | 350,00 [N/mm ²] |
| Toelaatbare spanning (kort) | 10,00 [N/mm ²] |
| Toelaatbare spanning (lang) | 6,50 [N/mm ²] |
| Tensile factor (alfa) | 0,65 [-] |
| Lineaire uitzettingscoëff. (alfa_g) | 0,0001800 [mm/mmK] |
| Uitwendige diameter leiding | 800,00 [mm] |
| Wanddikte (Nominaal) | 72,70 [mm] |
| Volumegewicht leidingmateriaal | 9,54 [kN/m ³] |
| Ontwerpdruck | 0,00 [bar] |
| Incidente druk | 0,00 [bar] |
| Temperatuur variatie | 50,00 [gr C] |

2.13 Gegevens voor Leidingberekening

| | |
|---|-------------------------------|
| Leiding gevuld met water op rollen | Nee |
| Percentage leiding gevuld met vloeistof | 100 [%] |
| Volume gewicht vloeistof | 10,00 [kN/m ³] |
| Opleghoek | 120 [grd] |
| Belastingshoek | 180 [grd] |
| Relatieve verplaatsing | 10,00 [mm] |
| Samendrukkingconstante | 6,00 [-] |
| Beddingsconstante boorvloeistof (Kv) | 500,00 [kN/m ³] |
| Hoek van inwendige wrijving boorvloeistof | 15,00 [grd] |
| Cohesie boorvloeistof | 5,00 [kN/m ²] |
| Wrijvingsfactor leiding-rollenbaan (f1) | 0,10 [-] |
| Wrijvingscoefficient leiding-boorvloeistof (f2) | 0,000050 [N/mm ²] |
| Wrijvingsfactor leiding-grond (f3) | 0,20 [-] |

2.14 Boorvloeistof Gegevens

| | |
|---|---------------------------------|
| Uitwendige diameter boorgat pilotboring | 0,365 [m] |
| Uitwendige diameter pilotbuis | 0,168 [m] |
| Uitwendige diameter boorgat voorruimen | 1,040 [m] |
| Uitwendige diameter buis voorruimen | 0,168 [m] |
| Uitwendige diameter uiteindelijke boorgat | 1,040 [m] |
| Uitwendige diameter leiding | 0,800 [m] |
| Debit tijdens pilotboring | 2000,0000 [liter/minuut] |
| Debit tijdens voorruimen | 1850,0000 [liter/minuut] |
| Debit tijdens intrekken | 1600,0000 [liter/minuut] |
| Factor debietverlies tijdens pilotboring | 0,30 [-] |
| Factor debietverlies tijdens voorruimen | 0,20 [-] |
| Factor debietverlies tijdens intrekken | 0,20 [-] |
| Volumegewicht boorvloeistof | 11,5 [kN/m ³] |
| Zwichtspanning boorvloeistof | 0,014 [kN/m ²] |
| Viscositeit boorvloeistof | 0,000040 [kN.s/m ²] |

2.15 Factoren

| | |
|---|----------|
| (Polyetheen)Veiligheidsfactor implosie (Lang) | 3,0 [-] |
| (Polyetheen)Veiligheidsfactor implosie (Kort) | 1,5 [-] |
| Onzekerheidsfactor volumegewicht | |
| van materiaaltypen onder en boven freatische lijn | 1,10 [-] |
| Onzekerheidsfactor (gedraaideerde) cohesie C | 1,40 [-] |

| | | |
|---|-------|---------------------------------|
| Onzekerheidsfactor ongedraineerde schuifsterkte Su | 1,40 | [⁻] |
| Onzekerheidsfactor Phi | 1,10 | [⁻] |
| Onzekerheidsfactor E-modulus | 1,25 | [⁻] |
| Onzekerheidsfactor beddingsconstante | 2,00 | [⁻] |
| Belastingsfactor ontwerpdruk (Polyetheen) | 1,00 | [⁻] |
| Belastingsfactor ontwerpdruk (combinatie) (Polyetheen) | 1,00 | [⁻] |
| Belastingsfactor testdruk (Polyetheen) | 1,00 | [⁻] |
| Belastingsfactor aanlegbelasting (Polyetheen) | 1,00 | [⁻] |
| Belastingsfactor gereduc. neut. grondspan. q_n;r (Polyetheen) | 1,50 | [⁻] |
| Belastingsfactor temperatuur (Polyetheen) | 1,10 | [⁻] |
| Belastingsfactor verkeersbelasting (Polyetheen) | 1,35 | [⁻] |
| Importantie factor (S) | 0,75 | [⁻] |
| Toelaatbare deflectie stalen leiding | 15,00 | [[%]] |
| Toelaatb. deflectie stalen leiding bij inspectie ('piggability') | 5,00 | [[%]] |
| Toelaatbare deflectie polyetheen leiding | 8,00 | [[%]] |
| Toelaat. deflectie polyetheen leiding bij inspectie ('piggability') | 5,00 | [[%]] |
| Volumegewicht water | 10,20 | [^{kN/m³}] |
| Veiligheidsfactor dekking (gedraineerde lagen) | 0,50 | [⁻] |
| Veiligheidsfactor dekking (ongedraineerde lagen) | 0,50 | [⁻] |
| Verhouding H/Do voor grens tussen ondiepe en diepe situatie | 7,50 | [⁻] |

2.16 Rekenopties

Stress analyse optie : Standaard

3 Boorvloeistofdrukken

3.1 Boorvloeistof Gegevens

| Verticaal nr. | Boorvloeistofdrukken pilot [kN/m ²] | | | |
|---------------|--|----------------|------------|-------------|

4 Grondmechanische Data

4.1 Grondmechanische Parameters (Leiding: 800mm PE100 SDR11 (1))

De volgende gegevens en uitgangspunten zijn gehanteerd voor de sterkteberekening:
Merk op: veiligheidsfactoren niet toegepast.

| | | |
|-----------|---|-------------------|
| q_v;p | Passieve grondspanning | kN/m ² |
| q_v;n | Neutrale grondspanning | kN/m ² |
| q_h;n | Neutrale horizontale grondspanning | kN/m ² |
| q_v,r;n | Gereduceerde neutrale grondspanning | kN/m ² |
| q_verkeer | Verkeersbelasting | kN/m ² |
| q_v;e | Verticaal evenwichtsdraagvermogen | kN/m ² |
| q_h;e | Horizontaal evenwichtsdraagvermogen | kN/m ² |
| k_v;bot | Verticaal beddingsgetal omlaag | kN/m ³ |
| k_v;top | Verticaal beddingsgetal omhoog | kN/m ³ |
| k_h | Horizontaal beddinggetal | kN/m ³ |
| t_max | Maximale wrijving leiding-boorvloeistof | kN/m ² |
| d_max | Corresponderende verplaatsing bij mobilisatie maximale wrijving | mm |

| Verticaal nr. | q_v;p [kN/m ²] | q_v;n [kN/m ²] | q_h;n [kN/m ²] | q_v,r;n [kN/m ²] | q_verkeer [kN/m ²] | q_v;e [kN/m ²] |

Maximale grondspanning : q_v;n;max = 748 kN/m²
 Maximale gereduceerde grondspanning (incl. verkeersbelastingen) : q_verkeer;max = 61 kN/m²
 Maximale gereduceerde grondspanning : q_v;r;n;max = 61 kN/m²
 Maximale verticale beddingsconstante (zonder veiligheidsfactor)
 alleen voor verticalen in diepe situatie : k_v;max = 342702 kN/m³
 Maximale verticale beddingsconstante (veiligheidsfactor toegepast)
 alleen voor verticalen in diepe situatie : k_v;max = 685403 kN/m³

4.2 Young's Modulus per Laag per Verticaal

5 Gegevens voor Sterkteberekening

5.1 Algemene Gegevens

| | | |
|---|---|-----------------------------------|
| Equivalent diameter leiding | : | $D_o = 800,00 \text{ mm}$ |
| Equivalente nominale wanddikte | : | $t = 72,70 \text{ mm}$ |
| Equivalente volumegewicht leidingmateriaal | : | $\gamma_s = 9,54 \text{ kN/m}^3$ |
| Maximale verticale beddingsconstante (zonder veiligheidsfactor) | : | $k_v;max = 342702 \text{ kN/m}^3$ |
| Volumegewicht boorvloeistof | : | $\gamma_b = 11,50 \text{ kN/m}^3$ |
| Kromtestraal op rollenbaan (intrekboog) | : | $R_{rol} = 350,000 \text{ m}$ |
| Wrijvingscoëfficiënt leiding/rollenbaan | : | $f_1 = 0,10$ |
| Wrijving tussen leiding en boorvloeistof | : | $f_2 = 0,000050 \text{ N/mm}^2$ |
| Wrijvingscoëfficiënt leiding/grond | : | $f_3 = 0,20$ |

5.2 Ballasten Leiding

Het opdrijvend vermogen van de productbuis in de boorvloeistof heeft invloed op de wrijving tussen de grond en de leiding. Door het ballasten van de leiding neemt de opwaartse kracht van de leiding in de boorvloeistof af. Bij een optimaal vullingpercentage is de wrijvingskracht tussen de leiding en de wand van het boorgat minimaal

Bij een vulling percentage van 100% ontstaat het volgende resulterende gewicht.

| | | | |
|---|---|-----|-----------------------------------|
| Opwaartse kracht | : | 589 | [kg/m] |
| Gewicht productbuis (inclusief vulling) | : | 505 | [kg/m] |
| Resultaat | : | 85 | [kg/m] (Leiding beweegt opwaarts) |

5.3 Trekkraftberekening

Tijdens het intrekken van de leiding door het boorgat ondervindt de buis een wrijving die is opgebouwd uit:

- wrijving tussen buis en rollenbaan ($f_1 = 0,10$)
- wrijving tussen buis en boorvloeistof ($f_2 = 0,000050 \text{ [N/mm}^2\text{]}$)
- wrijving tussen buis en grond ($f_3 = 0,20$)

Door het optreden van wrijving tijdens het intrekken ontstaat een trekkraft in de leiding.
De pijpleiding wordt van links naar rechts ingetrokken.

Bij het berekenen van de trekkrachten wordt rekening gehouden met het feit dat de lengte van de buis op de rollenbaan afneemt naarmate de doortrekooperatie vordert. Bij het berekenen van de trekkraft wordt uitgegaan van een stabiel boorgat.

| Karakteristieke punten | Lengte leiding in gat (m) | Karakteristieke waarde voor de trekkraft (kN) |
|------------------------|------------------------------|--|
| T1 | 0 | 159 |
| T2 | 30 | 163 |
| T3 | 170 | 219 |
| T4 | 852 | 347 |
| T5 | 971 | 404 |
| T6 | 1004 | 409 |

De berekende waarden van de trekkraft zijn karakteristieke waarden waarop nog een totaalfactor voor stochastische variatie en modelonzekerheid (f) van tenminste 1.4 moet worden toegepast in de sterke berekening, volgens art. E.1.2.1 van NEN 3650-1:2012. In de sterkteberekening (volgend hoofdstuk) is een factor van 2,00 gebruikt en een belasting factor van 1,00.

De maximale representatieve trekkraft is 1493 kN, exclusief rekenfactor. Bij deze trekkraft zijn de spanningen in de leiding gelijk aan de toelaatbare spanning.

6 Sterkteberekening van Leiding: 800mm PE100 SDR11 (1)

6.1 Materiaalgegevens van Leiding: 800mm PE100 SDR11 (1)

De volgende gegevens en uitgangspunten zijn gehanteerd voor de sterkteberekening:

| | | |
|---|---|------------------------------------|
| Leiding materiaal | : | Polyethene PE100 |
| Buiten- diameter | : | Do = 800,00 mm |
| Nominale wanddikte | : | t = 72,70 mm |
| Ontwerpdruck | : | pd = 0,00 bar |
| Test druk | : | pt = 0,00 bar |
| Temperatuur variatie | : | dt = 50,00 deg Celcius |
| Lengte leiding | : | L = 1004 m |
| Elasticitetsmodulus (kort) | : | E = 975 N/mm ² |
| Elasticitetsmodulus (lang) | : | E = 350 N/mm ² |
| Toelaatbare spanning (kort) | : | S = 10 N/mm ² |
| Toelaatbare spanning (lang) | : | S = 7 N/mm ² |
| Importantie factor (S) | : | S = 0,75 |
| Volumegewicht leidingmateriaal | : | gamma_s = 9,54 kN/m ³ |
| Opleghoek | : | beta = 120 graden |
| Belastingshoek | : | alfa = 180 graden |
| Momentcoëfficiënt grond top (indirect) | : | kt' = 0,061 |
| Momentcoëfficiënt grond bodem (indirect) | : | kb' = 0,083 |
| Momentcoëfficiënt grond top (direct) | : | kt = 0,131 |
| Momentcoëfficiënt bodem (direct) | : | kb = 0,138 |
| Deflectiecoëfficiënt (indirect) | : | ky' = 0,048 |
| Deflectiecoëfficiënt (direct) | : | ky = 0,089 |
| Maximale gereduc. vert. grondbelasting (zonder veiligheidsfactor) | : | q_v;r;n;max = 61 kN/m ² |
| Verkeersbelasting (zonder veiligheidsfactor) | : | q_v = 0 kN/m ² |
| Maximale verticale beddingsconstante (zonder veiligheidsfactor) | : | k_v;max = 342702 kN/m ³ |
| Gebruikte straal (exclusief veiligheidsfactoren) | : | Rmin = 350,000 m |
| Belastingsfactor aanlegbelasting | : | f_install = 1,00 |
| Belastingsfactor gereduc. neut. grondspan. q_n;r | : | f_Qnr = 1,50 |
| Belastingsfactor ontwerpdruck | : | f_pd = 1,00 |
| Belastingsfactor ontwerpdruck (combinatie) | : | f_pd;comb = 1,00 |
| Belastingsfactor testdruk | : | f_pt = 1,00 |
| Belastingsfactor temperatuur | : | f_temp = 1,10 |
| Belastingsfactor verkeersbelasting | : | f_v = 1,35 |
| Onzekerheidsfactor kromte straal | : | f_R = 1,10 |
| Onzekerheidsfactor beddingsconstante | : | f_kv = 2,00 |
| Onzekerheidsfactor buigend moment | : | f_k = 1,40 |
| Totaalfactor op trekkracht voor stoch. varia. en modelonzekerheid | : | f = 2,00 |
| Lineaire uitzettingscoëfficiënt gemiddeld tussen t1 en t2 | : | alfa_g = 0,0001800 mm/mmK |

6.2 Resultaten Sterkteberekening van Leiding: 800mm PE100 SDR11 (1)

Voor de berekening worden 5 belasting fasen onderscheiden:

- Belasting combinatie 1A: begin trekoperatie
- Belasting combinatie 1B: einde van trekoperatie
- Belasting combinatie 2: intern op druk brengen
- Belasting combinatie 3: bedrijfsfase, niet op druk
- Belasting combinatie 4: bedrijfsfase, op druk

De wanddikte is 72,7 mm. Hierna wordt door middel van een berekening conform NEN 3650 serie aangetoond dat deze wanddikte voldoet

6.2.1 Belasting Combinatie 1A: Begin Trekoperatie

Axiale spanning:

$$\Sigma_b = M_b/W_b = f_k E \cdot l_b / (R_{rol} \cdot W_b) = 1,56 \text{ N/mm}^2$$

$$\Sigma_t = f \cdot f_{install} \cdot T_1/A = f \cdot f_{install} (L_{rol} \cdot Q \cdot f_1)/A = 1,92 \text{ N/mm}^2$$

$$\text{Maximale axiale spanning } \Sigma_a,\text{max} = 2,93 \text{ N/mm}^2$$

De tangentiele spanning is in deze fase verwaarloosbaar.

6.2.2 Belasting Combinatie 1B: Einde Trekoperatie

Axiale spanning:

$$\Sigma_b = Mb/Wb = f_k \cdot E \cdot I_b / (R_{min} \cdot Wb) = 1,56 \text{ N/mm}^2$$

$$\Sigma_t = f * f_{install} * T_{max}/A = 4,92 \text{ N/mm}^2$$

$$\text{Maximale axiale spanning } \Sigma_a,\text{max} = 5,93 \text{ N/mm}^2$$

Tangentiele spanning:

Belasting qr op de leiding ten gevolge van grondreactie bij bochten (volgens NEN 3650-1 katern-5 D3.3):

$$qr = kv * y = (0,322 \cdot \Lambda^2 \cdot E \cdot I) / (Do \cdot R / f_R)$$

$$\Lambda = (f_kv \cdot kv \cdot Do / (4 \cdot E \cdot I))^{0,25} = 1,9E-3 \text{ 1/mm}$$

$$qr = 0,0487 \text{ N/mm}^2$$

$$\Sigma_{qr} = k' \cdot qr \cdot (rg/Ww) \cdot Do = 1,34 \text{ N/mm}^2$$

$$\text{Maximale tangentiele spanning } \Sigma_t,\text{max} = 0,87 \text{ N/mm}^2$$

6.2.3 Belasting Combinatie 2: Intern op Druk Brengen

Ten gevolge van inwendige druk :

$$\Sigma_{py} = f_{pd} \cdot pd \cdot ((ru^2 + ri^2) / (ru^2 - ri^2)) = 0,00 \text{ N/mm}^2$$

$$\Sigma_{px} = 0,5 \cdot \Sigma_{py} = 0,00 \text{ N/mm}^2$$

$$\Sigma_{ptest} = f_{pt} \cdot pt \cdot ((ru^2 + ri^2) / (ru^2 - ri^2)) = 0,00 \text{ N/mm}^2$$

6.2.4 Belasting Combinatie 3: Bedrijfstoestand in Drukloze Situatie

Axiale spanning:

$$\Sigma_b = Mb/Wb = f_k \cdot E \cdot I_b / (R_{min} \cdot Wb) = 0,56 \text{ N/mm}^2$$

$$\text{Maximale axiale spanning } \Sigma_a,\text{max} = 0,36 \text{ N/mm}^2$$

Tangentiele spanning:

$$\Sigma_{qr} = k' \cdot qr \cdot (rg/Ww) \cdot Do = 0,80 \text{ N/mm}^2$$

$$\Sigma_{qn} = k \cdot qn \cdot (rg/Ww) \cdot Do = 4,17 \text{ N/mm}^2$$

$$\text{Maximale tangentiele spanning } \Sigma_t,\text{max} = 3,23 \text{ N/mm}^2$$

6.2.5 Belasting Combinatie 4: Bedrijfstoestand met Inwendige Druk

Axiale spanning:

$$\Sigma_b = Mb/Wb = f_k \cdot E \cdot I_b / (R_{min} \cdot Wb) = 0,56 \text{ N/mm}^2$$

Ten gevolge van inwendige druk :

$$\Sigma_{py} = f_{pd} \cdot pd \cdot ((ru^2 + ri^2) / (ru^2 - ri^2)) = 0,00 \text{ N/mm}^2$$

| | | | |
|---|---|-------|-------------------|
| Sigma_px = 0,5 · Sigma_py | = | 0,00 | N/mm ² |
| Sigma_ptest = f_pt · pt · ((ru ² + ri ²) / (ru ² - ri ²)) | = | 0,00 | N/mm ² |
| Sigma_Temp = dt * gamma_t * alpha_g * E | = | 3,47 | N/mm ² |
| Maximale axiale spanning Sigma_a,max | = | 3,83 | N/mm ² |
| Tangentiele spanning: | | | |
| Sigma_qr = k · qr · (rg/Ww) · Do | = | 0,80 | N/mm ² |
| Sigma_qn = k · qn · (rg/Ww) · Do | = | 4,17 | N/mm ² |
| 'Rerounding'-factor Frr | = | 1,000 | |
| 'Rerounding'-factor F'rr | = | 1,000 | |
| Sigma_t,max = Sigma_py + ((F'rr · Sigma_qr) + (Frr · Sigma_qn)) | | | |
| Maximale tangentiele spanning Sigma_t,max | = | 3,23 | N/mm ² |

6.3 Controle van de Berekende Spanningen van Leiding: 800mm PE100 SDR11 (1)

Belasting combinatie 1

- Sigma_AxMax < ShortStrength * DamageFactor
- Sigma_TanMax < ShortStrength * DamageFactor

Belasting combinatie 2

- Sigma_ptest < ShortStrength * DamageFactor
- Sigma_py < LongStrength * DamageFactor

Belasting combinatie 3

- Sigma_AxMax < LongStrength * DamageFactor
- Sigma_TanMax < LongStrength * DamageFactor

Belasting combinatie 4

- Sigma_AxMax < LongStrength * DamageFactor
- Sigma_TanMax < LongStrength * DamageFactor

Voor alle spanningssituaties zijn de spanningen toelaatbaar.

| | Max toelaatbare spanning [N/mm ²] | Spannings combinatie 1A | Spannings combinatie 1B | Spannings combinatie 2 | Spannings combinatie 3 | Spannings combinatie 4 |
|---------------|---|-------------------------|-------------------------|------------------------|------------------------|------------------------|
| Sigma_ptest | 7,50 (kort) | - | - | 0,00 | - | - |
| Sigma_py | 4,88 (lang) | - | - | 0,00 | - | - |
| Sigma_axiaal | 7,50 (kort) | 2,93 | 5,93 | - | - | - |
| Sigma_axiaal | 4,88 (lang) | - | - | - | 0,36 | 3,83 |
| Sigma_tang... | 7,50 (kort) | - | 0,87 | - | - | - |
| Sigma_tang... | 4,88 (lang) | - | - | - | 3,23 | 3,23 |

Spanningen in de leiding [N/mm²]

De deflectie van de leiding is 13,4 mm (1,68% x Do). De maximaal toelaatbare deflectie van de leiding is 48,0 mm (6,00% x S x Do). De deflectie is toelaatbaar.

De maximaal toelaatbare deflectie bij inspectie ('piggability') is 40,0 mm (5,00% x Do). De deflectie is toelaatbaar.

6.4 Toetsing op Implosie van Leiding: 800mm PE100 SDR11 (1)

Tijdens het intrekken wordt de leiding belast door de heersende bentonietdruk. De hoogste minimaal benodigde druk tijdens het intrekken is gelijk aan 474 kN/m², dit is kleiner dan de toelaatbare alzijdige uitwendige druk van 1546 kN/m².

Omdat de leiding tijdens dit intrekken geheel gevuld is met vloeistof geeft dit een tegendruk van 366 kN/m². De maximaal toelaatbare druk wordt dan 1911 kN/m².

Tijdens de bedrijfstoestand wordt de leiding belast door de heersende waterdruk. De uitwendige waterdruk op de leiding is gelijk aan 367 kN/m^2 , dit is groter dan de toelaatbare alzijdige uitwendige druk van 277 kN/m^2 .

Indien de leiding tijdens de gebruiksfase geheel gevuld blijft met vloeistof geeft dit een tegendruk van 366 kN/m^2 . De totale toelaatbare druk wordt dan 643 kN/m^2 . Hiermee rekening houden voldoet de leiding wel.

2.6 Grenslagen

De grens tussen (cohesieve) ongedraaide toplagen en onderliggende (niet-cohesieve) gedraaide lagen, ligt aan de bovenzijde van laag nummer 60: zand,ma_fi,lo (NA)

De grens tussen compressibele toplagen en de onderliggende niet-compressibele lagen, ligt aan de bovenzijde van laag nummer 60: zand,ma_fi,lo (NA)

2.8 Geometrie

2.8.1 Geometrie Sectie, Detail

2.8.2 Geometrie Bovenaanzicht

2.9 Berekenings Verticalen

| Verticaal nr. | L-coörd. [m] | Z-coörd. [m] |
|---------------|-----------------|-----------------|
| 1 | -912,400 | -30,927 |

Locaties berekenings verticalen; L is de horizontale coördinaat langs de leiding geprojecteerd op het horizontale vlak, opgehoogd met de intrede coördinaat.

2.10 Configuratie van de Pijpleiding

| | | |
|--|-----------|-------|
| X coördinaat linker punt | -1017,320 | [m] |
| Y coördinaat linker punt | 0,000 | [m] |
| Z coördinaat linker punt | 1,500 | [m] |
| X coördinaat rechter punt | -41,083 | [m] |
| Y coördinaat rechter punt | 0,000 | [m] |
| Z coördinaat rechter punt | 6,513 | [m] |
| Hoek links | 22,0000 | [grd] |
| Hoek rechts | 18,0000 | [grd] |
| Kromtestraal links, verticaal in/uit | 350,000 | [m] |
| Kromtestraal rechts, verticaal in/uit | 400,000 | [m] |
| Diepste punt van de pijpleiding (hart boortracé) | -35,000 | [m] |
| Hoek van de pijpleiding (tussen de stralen) | 1,0000 | [grd] |
| Aantal horizontale bochten: | 1 | |

De pijpleiding wordt van links naar rechts ingeduwd.

| Bocht nr. | X1-coörd. [m] | Y1-coörd. [m] | X2-coörd. [m] | Y2-coörd. [m] | Kromtestraal [m] | Richting |
|-----------|------------------|------------------|------------------|------------------|---------------------|----------|
| 1 | -827,268 | 56,466 | -486,449 | 76,656 | 750,000 | links |

2.11 Materiaalgegevens van de Leiding

| | | |
|--------------------------------|-------------|----------------------|
| Materiaal | Synthetisch | |
| Kwaliteit | PE100 | |
| Elasticiteitsmodulus (kort) | 975,00 | [N/mm ²] |
| Elasticiteitsmodulus (lang) | 350,00 | [N/mm ²] |
| Uitwendige diameter leiding | 800,00 | [mm] |
| Oversnijding op de straal | 120 | [mm] |
| Wanddikte (Nominaal) | 72,00 | [mm] |
| Volumegewicht leidingmateriaal | 9,54 | [kN/m ³] |

2.12 Gegevens voor Leidingberekening

| | | |
|--|--------|----------------------|
| Toegestane druk kracht | 100,00 | [kN] |
| Volume verlies als percentage van het oversnijdingsoppervlak | 20,00 | [%] |
| Relatieve verplaatsing | 10,00 | [mm] |
| Samendrukkingconstante | 6,00 | [\cdot] |
| Beddingsconstante boorvloeistof (K _v) | 500,00 | [kN/m ³] |
| Hoek van inwendige wrijving smeervloeistof | 15,00 | [grd] |
| Adhesie smeervloeistof | 5,00 | kN/m ² |
| Factor op phi voor gereduceerde grond belasting | 0,50 | [\cdot] |
| Delta smeervloeistof | 7,50 | [grd] |
| Wrijving met injectie | 7,50 | [kPa] |
| Wrijving zonder injectie | 10,00 | [kPa] |

2.13 Factoren

| | | |
|---|------|-------------|
| Veiligheidsfactor (gedraineerde) cohesie C | 1,40 | [\cdot] |
| Veiligheidsfactor ongedraineerde schuifsterkte S _u | 1,40 | [\cdot] |
| Veiligheidsfactor Phi | 1,10 | [\cdot] |
| Veiligheidsfactor effectieve druk | 1,50 | [\cdot] |
| Veiligheidsfactor waterdruk | 1,05 | [\cdot] |
| Veiligheidsfactor opdrijven | 1,00 | [\cdot] |

| | | |
|---|-------|----------------------|
| Onzekerheidsfactor gronddruk | 1,10 | [⁻] |
| Factor silo effect bovenliggende laagpakket | 2,00 | [⁻] |
| Stabiliteitsverhouding N | 3,00 | [⁻] |
| Volumegewicht water | 10,20 | [kN/m ³] |
| Verhouding H/Do voor grens tussen ondiepe en diepe situatie | 7,50 | [⁻] |

3 Deformaties

3.1 Zakking

Ten gevolge van de oversnijding zal maaiveld zinking optreden. De zinking is berekend met een volume verlies percentage van het oversnijdings oppervlak. In de berekening is 20,0 procent gebruikt.

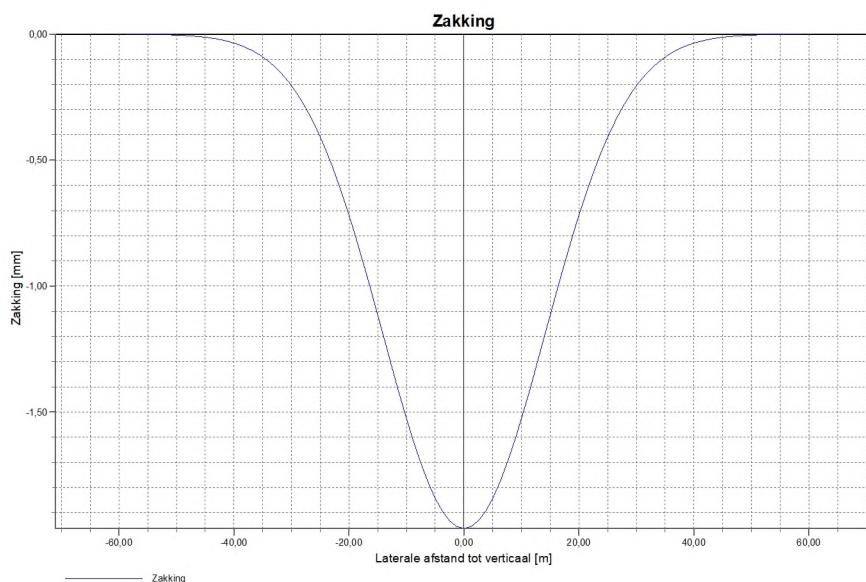

| | | |
|-----------------------------|---------|--------------------|
| Uitwendige diameter leiding | 800 | [mm] |
| Oversnijding op de straal | 120 | [mm] |
| Volume verlies | 69366,4 | [mm ²] |

3.1.2 Zakingswaardentabel

| Verticaal nr. | Zaking op horizontale afstand van de z as: | | | | | | | | | | |
|---------------|--|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|
| | 0 W [mm] | 0.1 W [mm] | 0.2 W [mm] | 0.4 W [mm] | 0.7 W [mm] | 1.0 W [mm] | 1.3 W [mm] | 1.6 W [mm] | 2.0 W [mm] | 2.5 W [mm] | 3.0 W [mm] |
| 1 | 2 | 2 | 2 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

W is de verticale afstand tussen het maaiveld en het buiscentrum

3.1.4 Grafiek Zakking bij Verticaal nr. 1

Einde Rapport
